PORTABLE DESKTOP MAGNIFIER WITH READING CAPABILITIES

Scan2Voice is a new breed of portable magnifying solutions which can read documents aloud. This elegant solution ships with advanced digital imaging equipment and cutting edge software, which provides everything you need for a feature-rich enjoyable experience.

The foldable, lightweight scanner clicks into various positions, which are calibrated to optimise clarity for different types of documents and images. Positions include standard A4/letter document height, as well as two levels of zoom, and a whiteboard position. Weighing only 1kg, the scanner is easy to transport and has been specifically designed for work, school, and home computers.

READ DOCUMENTS ALOUD

Scanned text can be converted to editable text with the included ABBYY® FineReader OCR software. An array of human sounding voices from Acapela is included to read text aloud.

UP TO 70x MAGNIFICATION

When developing the electronic 1-70x magnification capability, particular attention was placed on usability in day-to-day scenarios. Accordingly, you can easily navigate documents and objects using three imaging modes: live video streaming, captured images, and text which has been captured and converted into electronic format.

SCAN PAGE IN LESS THAN 1s

An entire A4/letter page can be scanned in less than 1 second at a resolution of more than 350 dpi. This is a very powerful feature to quickly scan, for example, books, magazines and batches of documents. Thanks to this high resolution, an optical zoom is no longer required. The electronic zoom makes navigating around the document much easier than moving the document beneath the camera.

COLOR ENHANCEMENT AND FALSE COLORS

To increase the readability of text, Scan2Voice allows you to customize your settings to suit your individual needs. Enhance your experience using a matrix of color and contrast controls, including standard white text on black background, negative mode, or even false colors, such as white text on a blue background.

LARGE DEPTH OF FIELD

The combination of the scanner's large depth of field and live video stream mode allows text on yogurt pots, pizza boxes, telephones and remote controls, for example, to be easily read.

WORD PROCESSING

Scan2Voice ships with an integrated word processor that can be used to edit texts that have been converted with ABBYY® FineReader® OCR, copied from the clipboard or from a Microsoft Word document. This allows scanned paper documents and electronic documents to be read aloud and for the creation of audio books. Documents can be saved as DOC or PDF files.
